January

2012

Did you know?

Green Fact:

Renewable energy comes from naturally replenished resources, including electricity and heat generated from solar, wind, ocean, hydropower, biomass, geothermal resources and biofuels, and hydrogen derived from renewable resources.¹

Blood Fact:

National Volunteer Blood Donor Month is celebrated every January. Annually over 15 million units of WB are collected in the U.S. from an ever shrinking pool of eligible donors. WB is a valuable resource and should be maximized to its fullest potential.

Did you know?

Green Fact:

Hydropower is prevalent in the U.S. since water is its most common renewable source of energy. Dams provide additional benefits such as recreational opportunities on upstream reservoirs, habitat for a wide variety of aquatic and terrestrial species, diversion of water for irrigation, and control of destructive flooding and environmental damage downstream.¹

Blood Fact:

Blood centers can reduce their ecological footprint by better utilizing the WB donations they collect everyday. By making WB-derived platelets you can maximize the value of WB donations and produce AcrodoseSM Platelets which are a safe and clinically equivalent alternative to apheresis.

Did you know?

Green Fact:

When opened in 1961, the Niagara project was the largest hydropower facility in the western world. Today, it is the biggest electricity producer in New York state, generating 2.4 million kilowatts—enough power to light 24 million 100-watt bulbs at once, this saves hundreds of millions of dollars each year.¹

Blood Fact:

Of the 15 million units of WB collected in the U.S. each year, only 2 million units are processed into WB platelets. If all units were processed into platelets, it would meet the entire platelet demand of the U.S., resulting in an estimated annual savings of over \$275M.^{2,3}

Did you know?

Green Fact:

Wind energy, the world's fastest-growing energy technology, currently supplies about 1% of the U.S. electricity needs. Wind turbines placed at sites with strong, steady winds can generate electricity without producing pollutants. The strongest winds tend to be in Alaska, the western U.S., and the Appalachians.¹

Blood Fact:

Blood centers are increasingly turning to Acrodose Platelets due to its higher margins, while hospitals prefer Acrodose Platelets due to its lower cost. Both blood centers and hospitals have seen the clinical and financial value of providing and using Acrodose Platelets which are now available in over 46 states in the U.S.

Did you know?

Green Fact:

For hundreds of years, humans have used wind to pump water or grind grain, usually with small windmills. Today large, modern wind turbines are used to generate electricity, either for individual use or for contribution to a utility power grid.¹

Blood Fact:

An Acrodose Platelet enables blood centers to tap into the abundant, but often discarded resource of WB-derived platelets, while providing the equivalent clinical benefits of an apheresis platelet. Because of their abundant supply and low cost, the production of a therapeutic dose of WB-derived platelets can eliminate the reliance on costly apheresis platelets.

Did you know?

Green Fact:

Solar technologies use the sun's energy to provide heat, light, hot water, electricity, and even cooling, for homes, businesses, and industry. Despite sunlight's significant potential for supplying energy, solar power provides less than 1% of U.S. energy needs.¹

Blood Fact:

With the Leukotrap[®] RC PL System, you can collect all your WB donations in one system and produce leukoreduced RBC, platelets and plasma. Then you can produce Acrodose Platelets, reducing your ecological impact in the process.

2012

Did you know?

Green Fact:

Solar technologies produce few negative environmental impacts during collection; however, there are concerns with the production of collectors and storage devices. Although sunlight is free, solar cells and the equipment needed to convert their direct-current output to alternating current for use in a house is expensive.¹

Blood Fact:

A recent study confirmed that risks to apheresis donors (mainly reactions during procedures) are substantially higher than risks to WB donors. The authors stated, "If safety and efficacy of the two components, either apheresis PCs or whole blood-derived PCs, are equivalent, the difference in donor complications is a strong argument to prefer whole blood derived PCs".²

Did you know?

Green Fact:

Biomass power is obtained from the energy in plants and plant-derived materials, such as food crops, grassy and woody plants, residues from agriculture or forestry, and the organic component of municipal and industrial wastes. It provides two valuable services: it is the second most important source of renewable energy in the U.S. and is an important part of our waste management infrastructure.¹

Blood Fact:

Pall Medical can help optimize your whole blood derived platelet processing so that the number of platelet concentrates (PC's) per pool can be reduced when producing Acrodose Platelets. As a result more therapeutic doses can now be produced from the same number of PC's providing you with increased productivity, increased availability, and increased revenues and margins.

Did you know?

Green Fact:

The two most common types of biofuels, liquid fuels produced from plants, are ethanol and biodiesel. Ethanol is an alcohol, the same as in beer and wine. It is made by fermenting any biomass high in carbohydrates through a process similar to beer brewing. The majority of ethanol produced in the U.S. is made from corn.¹

Blood Fact:

Increasingly splitting apheresis units into double and triple units is becoming more of the norm; however a recent study demonstrated that "high-yield platelet-pheresis donation can correlate with reduced transfusion efficacy and that in-vivo studies are necessary to assess the quality of the products".²

Did you know?

Green Fact:

Currently most geothermal power is generated using steam or hot water from underground. This power supply produces few emissions and is continuously available. In 2010, although the U.S. led the world in geothermal electricity production, this source currently meets less than 1% of U.S. power needs.¹

Blood Fact:

Non-leukoreduced WB-derived platelets (WBDP) can be made with the Leukotrap[®] RC System with RC2D Filter. These non-LR WBDPs can then be pooled and leukoreduced using the Acrodose[™] P_{Lus} System, producing a transfusion-ready, therapeutic dose of platelets - an Acrodose Platelet which is clinically equivalent to an apheresis platelet.

Did you know?

Green Fact:

In 1921 the first U.S. geothermal power plant went into operation at The Geysers, north of San Francisco. Today, The Geysers satisfies nearly 60% of the average electricity demand in the North Coast region of California from the Golden Gate Bridge to the Oregon border.¹

Blood Fact:

Since Acrodose Platelets use platelets collected from WB which is collected manually, it eliminates the dependence on alternative methods of blood collection. This includes apheresis collection machines, which require excess energy, resources, and expenses to run and maintain.

Did you know?

Green Fact:

By switching a single 100W bulb to a low energy light bulb you can save \$19/year. The energy savings could therefore pay for the initial cost of replacing the bulb within the first year, as well as reducing your carbon footprint.¹

Blood Fact:

Reducing your dependence on apheresis platelets by as little as 10% and replacing this volume with Acrodose Platelets, will not only significantly reduce your platelet production costs, it will reduce your carbon footprint. For a blood center producing 10,000 doses of platelets per year, the savings could be as much as \$100,000.²
