Helping you build a smarter diagnostic assay

When you collaborate with Cytiva you get access to a wide selection of high performance, customizable components and solutions for immunoassay and molecular diagnostic applications. Our innovative stabilization technologies enable you to manufacture diagnostic kits that don't require refrigeration during shipping and storage, helping you to reach more patients at point of care. You also benefit from Cytiva's extensive experience and expertise, not only when unexpected issues emerge, but from design stage through launch. Our experts will help you optimize components, identify the best-suited technologies, and offer invaluable assistance to help expand your customer base and get you in-market earlier. That's what smart, reliable, and cost-efficient diagnostic solutions are made of.

Point-of-care immunoassays

Cytiva is an established technology component provider for point-of-care immunodiagnostic assays, specifically:

- Lateral-flow immunoassays
- Flow-through immunoassays
- Dipstick colorimetric assays

We produce a vast array of cellulose and glass fiber substrates and nitrocellulose membranes to an assured quality, ensuring accurate and reproducible results.

Lateral-flow immunoassay

With a diverse array of products, Cytiva is one of the leading suppliers in lateral-flow technology. Our offering includes our wide range of blood separation products, conjugate release pads, nitrocellulose membranes, and absorbents.

Developments in lateral-flow immunoassay systems allow for single step assays that require only the addition of a sample. The sample flows through the device and comes in contact with dried reagents, usually a tagged secondary antibody. The antibody and analyte migrate to a capture zone of membrane-immobilized antibody. Any unreacted tagged antibody flows past the capture zone.

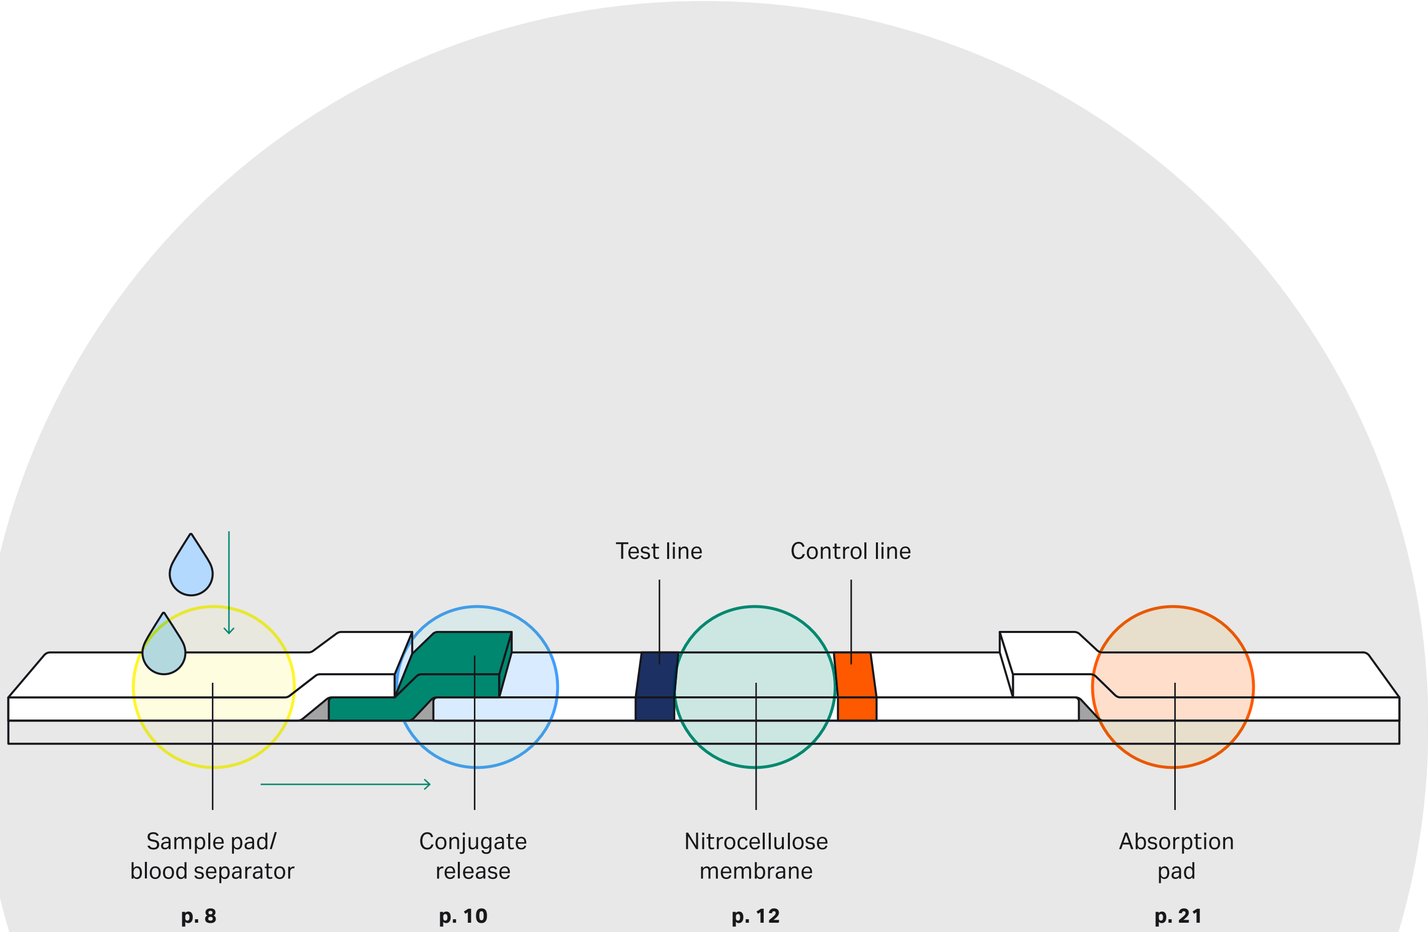

Fig 1. Drawing of a lateral flow immunoassay, showing its different components.

Sample pads for lateral-flow immunoassay

Sample pads begin the assay by transporting samples from the point of application to the test components.

To ensure that your assay begins without complications, Cytiva offers a complete range of high-quality sample pad materials.

Features and benefits:

- **Consistent absorbency and wicking rates:** Ensures test-to-test reproducibility
- **Product manufactured in controlled environments from highest-quality material:.** No false results due to sample contamination
- **Low protein binding:** Minimal loss of analyte, so test sensitivity is maintained
- **Naturally hydrophilic:** Rapid rewetting after prolonged storage
- **Wide range of thickness, absorbency and wicking rate**
- **Compatible with most styles of housings**
- **Minimal leakage along the strip:** No contamination of test results

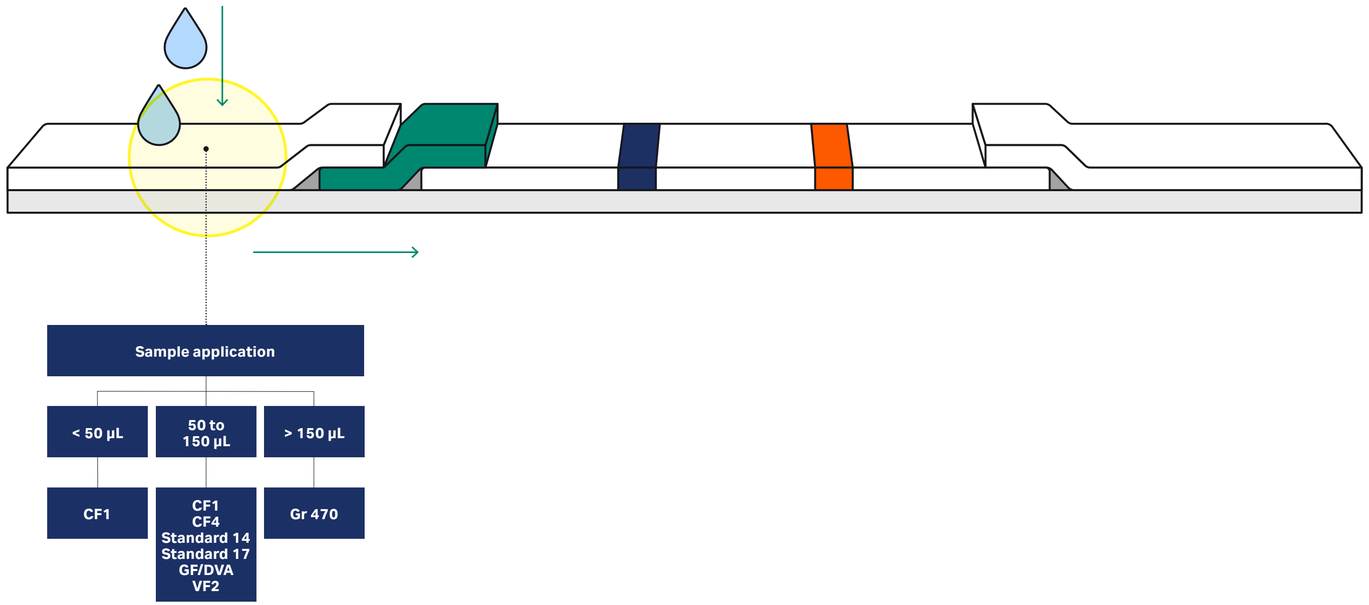

Fig 2. Sample pads selection tree.

Technical properties / ordering information

Product code	Product	Material	Properties	Thickness (µm @ 53 kPA)	Wicking rate (s/4 cm)	Water absorption (mg/cm²)	Dimensions
8111-2250	CF1	100% cotton linter	Light, thin grade suitable for small volume	176	207.3	18.7	CF1 22 mm × 50 m
8114-2250	CF4			482	67.3	49.9	CF4 22 mm × 50 m
8133-2250	Gr470			840	77	78	STD 14 22 mm × 50 m
8134-2250	Standard 14	Bound glass fiber	Faster flow than cotton, with lower sample retention	355	23.1	50.9	STD 17 22 mm × 50 m
8124-1750	Standard 17			370	34.5	44.9	VF2 17 mm × 50 m
10539995	GF/DVA		Works well with saliva samples and can act as a blood separator as well	785	28.2	93	GRADE 470 22 mm × 50 m
8124-1750	VF2			785	23.8	86.2	VF2 17 mm x 50 m

Blood separators for lateral-flow immunoassays

Because of the increasing demand for whole-blood assays, Cytiva offers a family of blood separators to meet the strict requirements of the rapid diagnostic market. Our blood separators for lateral-flow immunoassays enable whole blood analysis, with no red cell hemolysis.

The highly asymmetric Vivid plasma separation membranes are optimized for one-step plasma separation from whole blood without the need for centrifugation and our patented Leukosorb leukocyte removal medium is a highly wettable, fibrous matrix designed for use in procedures requiring isolation of leukocytes from whole blood samples.

Features and benefits:

- **Separation in 30 to 120 s:** Rapid assays save time
- **No appreciable red cell hemolysis:** Improved reproducibility
- **Consistency of materials:** Reliability
- **Materials suitable for use in a range of tests:** Flexibility in test optimization
- **Choice of separation times:** Allows for test optimization
- **Separators appropriate for a range of blood volumes:** Enhances the separation rate according to the volume of blood available

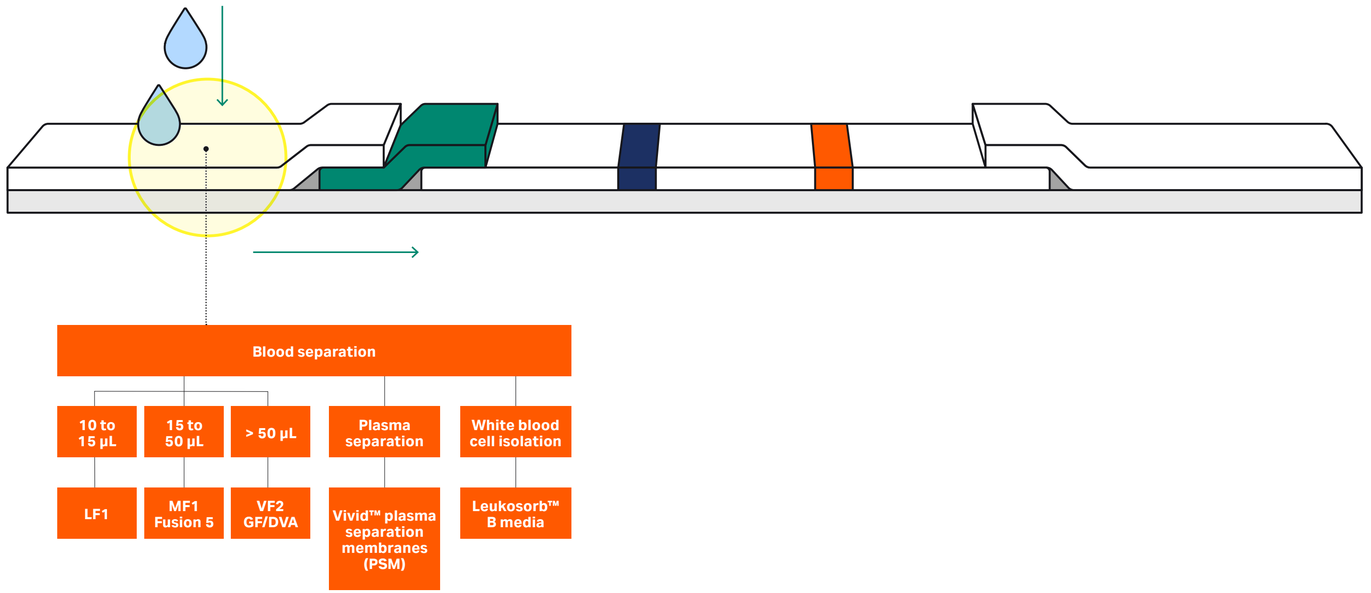

Fig 3. Blood separator selection tree.

Technical properties / ordering information

Product code	Product	Properties	Thickness (µm @ 53 kPA)	Wicking rate (s/4 cm)	Water absorption (mg/cm²)	Dimensions
8121-1750	GF/DVA	Bound glass fiber	785	28.2	93	LF1 17 mm × 50 m
8122-2250	LF1	May be used for lateral flow assays. Works well with one drop of whole blood	247	35.6	25.3	MF1 22 mm × 50 m
8124-1750	MF1	Used for lateral- or vertical-flow assays. Typically used for whole-blood volumes around 100 µL	367	29.7	39.4	VF2 17 mm × 50 m
8151-9915	VF2	Vertical separator used as single or multiple layers for separation of a wide range of blood volumes	785	23.8	86.2	Fusion 5 22 mm × 50 m
8145-2250	Fusion 5	Can be used as a lateral flow blood separator with two drops of whole blood	370	43.9	42.3	GF/DVA 22 mm × 50 m
T9EXPPA0200S00A	Vivid GF PSM	Highly asymmetric membranes allowing the cellular components of the blood to be captured in the larger pores without lysis, while the plasma flows down into smaller pores on the downstream side of the membranes	330	-	-	8" × 11" sheet 1.25" sheet 8" sheet 9" sheet 1.5" sheet 4.5" sheet

BSP0669	Leukosorb media	Highly wettable, fibrous matrix designed for use in procedures requiring isolation of leukocytes from whole blood samples	355.6 to 558.8	-	-	8" × 10 " sheet

Custom sizes and specifications available on request. Contact your local Diagnostic Account Manager.

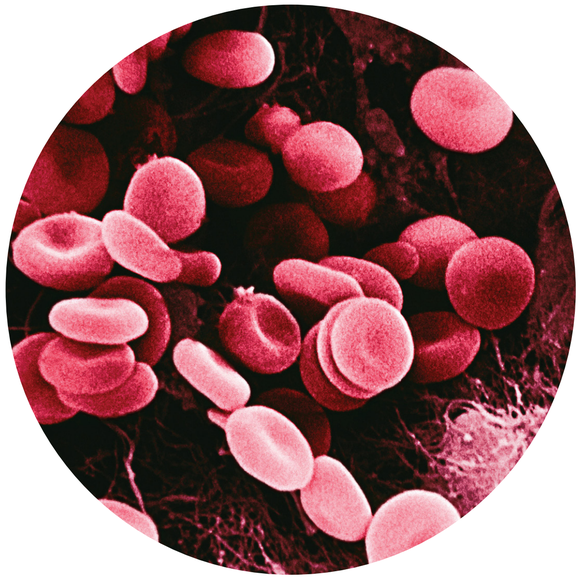

Fig 4. Enlarged view of blood separation.

Conjugate release for lateral-flow immunoassay

Conjugate release pads are critical to lateral-flow immunoassays. To ensure consistent performance, the conjugate must dry without damage or aggregation and release rapidly when the sample comes into contact with it.

Whatman™ conjugate release pads do not require treatment prior to conjugate application, as they are inherently hydrophilic. The open structure of the material allows rapid penetration by both conjugate and sample.

Features and benefits:

- **Higher level of conjugate release:** Less waste means reduced reagent costs
- **Higher capture line intensity, as more conjugate gets to the capture line:** Improved sensitivity
- **Pad rewets naturally and rapidly every time:** Improved consistency

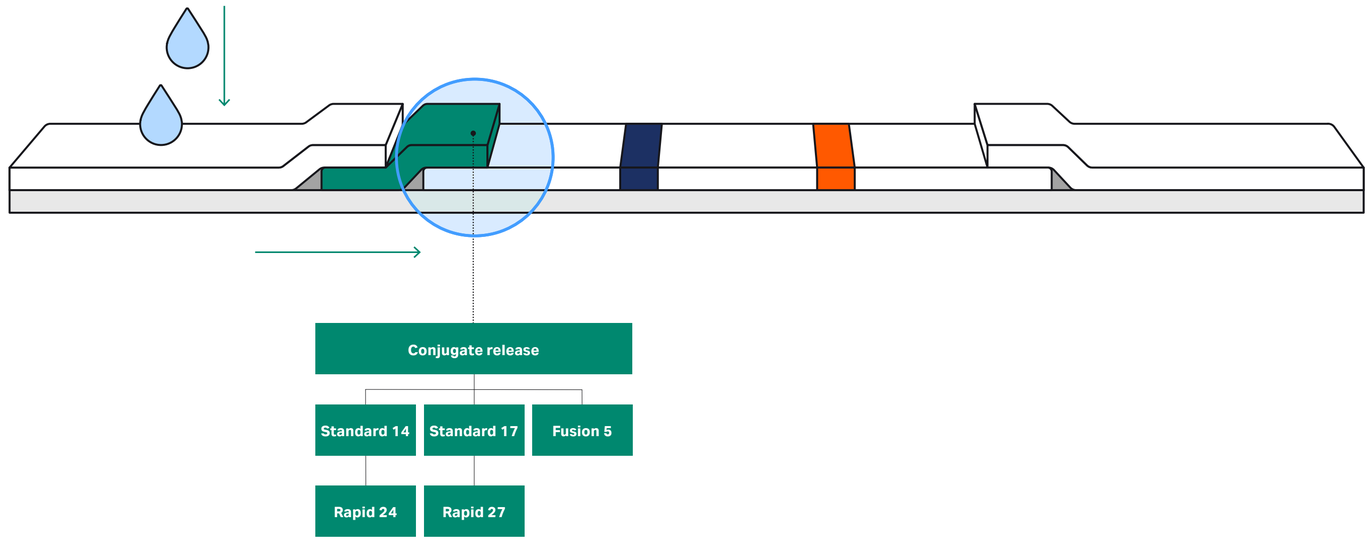

Fig 5. Conjugate release selection tree.

Technical properties / ordering information

Product code	Grade	Thickness (µm @ 53 kPA)	Wicking rate (s/4 cm)	Water absorption (mg/cm²)	Percent release of gold conjugate (after 90 s)	Dimensions
8133-2250	Standard 14	355	23.1	50.9	75	STD 14 22 mm × 50 m
8134-2250	Standard 17	370	34.5	44.9	75	STD 17 22 mm × 50 m

8131-2250	Rapid 24	348	20	52	80	22 mm × 50 m
8132-2250	Rapid 27	370	28	49	80	22 mm × 50 m

Other slit widths are available; please contact your Cytiva representative for more information.

Membranes for lateral-flow immunoassays

Nitrocellulose membranes are a key functional part of lateral-flow immunoassays.

The membrane must provide sufficient protein binding to produce a sharp and intense capture line, but at the same time the level of nonspecific background must be low enough for easy interpretation of the results.

Nitrocellulose membranes are available in a range of wicking rates and formulations. The wicking rate of a membrane has a significant impact on test sensitivity.

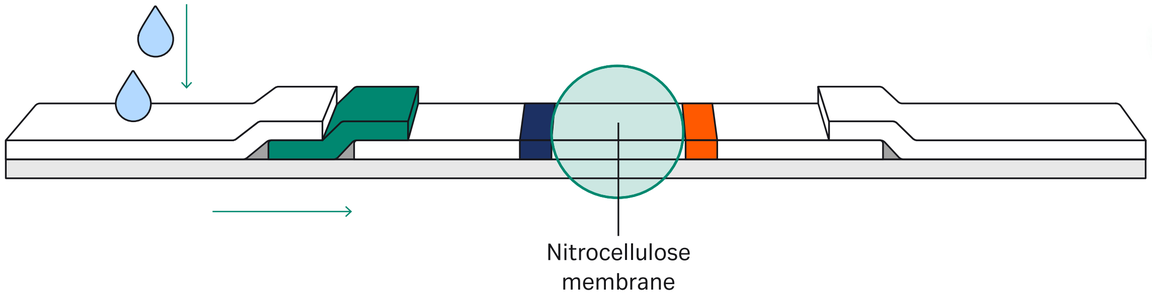

Fig 6. FF120HP membrane.

Membrane selector according to sample type

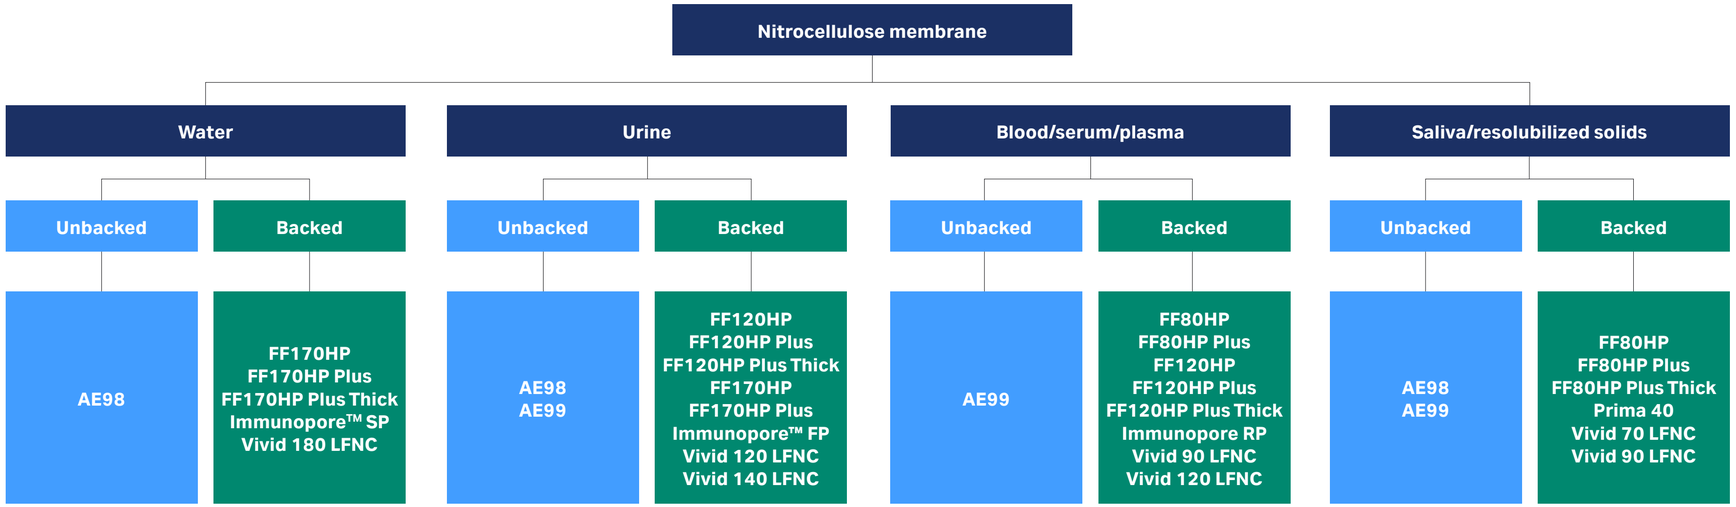

Table 2: Comparison between backed and unbacked membrane features

Backed membrane	Unbacked membrane
• Increased mechanical strength of the membranes, simplifying use in reel-to-reel machines • Direct contact is prevented between the nitrocellulose material and the adhesive from the lamination card where the test elements are mounted	• Enables assay suitability tests of both air and belt side of the membrane

AE nitrocellulose membranes

Constructed of 100% nitrocellulose, the AE membrane family offers a higher level of purity and performance than that seen in post-treated materials. AE membranes have been used extensively since the development of the original lateral flow tests and have become a standard for manufacturers worldwide. There is a long history of success and experience for assay optimization using these products.

AE membranes are unbacked, which means either belt or air side of the membrane can be used.

Technical properties / ordering information

Product code	Grade	Capillary rise (s/4 cm)	Total caliper (µm)	Properties	Dimensions
10549916	AE98	160 to 210	120	An unsupported membrane that gives good line intensity for use with low-viscosity samples	AE98 25mm x 50m 1/pk
10548081	AE99	120 to 160	120	A general-purpose membrane for use with most sample types giving a good combination of sensitivity with fast wicking	AE99 25 mm × 50 m 1/pk

Custom sizes and specifications available on request. Contact your local Diagnostic Account Manager.

FF high performance — backed nitrocellulose membranes

FF High Performance (HP) membranes are part of the AE family (see page 21) that are directly cast onto a plastic film.

The FF HP membranes are a result of improved membrane casting procedures, which result in enhanced intra- and inter-lot consistency and sharper lines.

The surface is uniform without any unincorporated nitrocellulose powder and the fine structure fiber distribution provides large internal surfaces for binding proteins.

A carefully designed and rigorous manufacturing process results in membranes with high reproducibility and very low intra- and inter-lot variability.

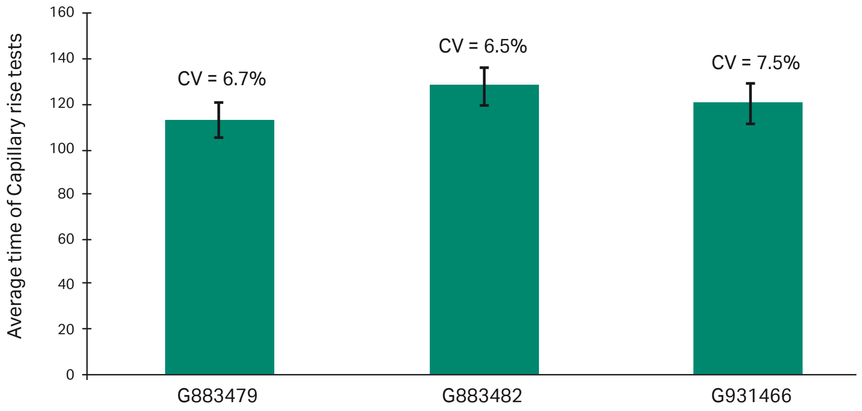

Fig 7. CV and average time of capillary rise tests of three batches. The average time of capillary rise for Lot G883479 was 112.6 ± 7.6 s while that of Lot G883482 was 127.7 ± 8.2 s. In addition, Lot G931466 had an average of 119.7 ± 8.9 s. The CVs for all three batches were 6.7%, 6.5%, and 7.5%, respectively.

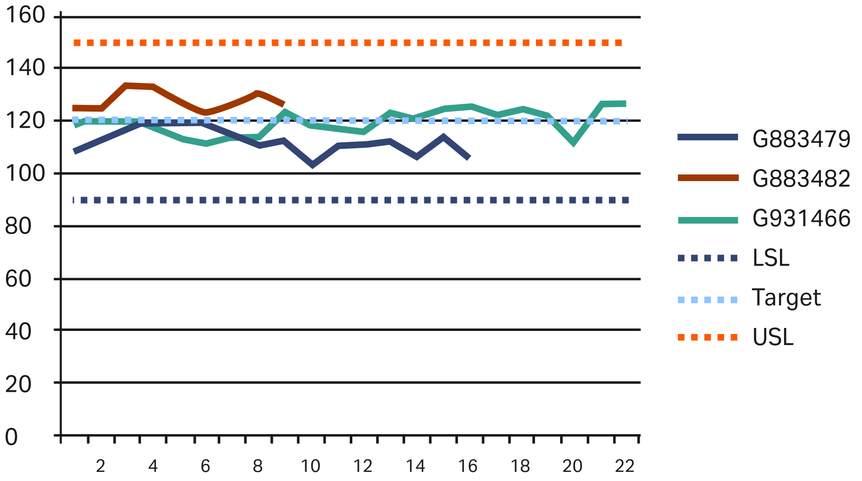

Fig 8. Representation of the capillary rise results shown in figure 10.

Vivid lateral-flow nitrocellulose membranes

Nitrocellulose is the globally preferred membrane substrate in point-of-care diagnostic tests where antigen-antibody binding occurs, e.g., pregnancy tests, urine-albumin tests, and C-reactive protein (CRP) detection. Vivid LFNC membranes fulfil all the criteria to enable the development and manufacture of a diverse range of tests with reliability and reproducibility. Vivid LFNC membranes are designed and tested specifically for diagnostic applications to ensure the materials meet stringent requirements for diagnostic assay development and manufacturing.

- Coefficients of variation (CV) between 5% and 10%
- Designed for assay reproducibility and sensitivity — High sensitivity with dilute concentrations of target analytes.
- Strong consistency and high duplication rate — When measuring intra- and inter-lot performance for wicking time and thickness Vivid LFNC membranes provide consistent results, resulting in low defined coefficients of variation.
- Clear surface appearance — Controlled surface quality of the membrane ensures freedom from visual defects, discoloration and dust.
- Clear results — Demonstrates low background levels which enable crisp capture lines and easy-to-read results.

The reliable, large-scale, manufacturing capacity with lot-to-lot traceability, choice of defined capillary speeds to select sensitivity of diagnostic test and straight and uniform migration front make Vivid nitrocellulose membranes a popular choice with diagnostic assay developers.

Absorption pads

Absorption pads at the downstream end of tests control sample flow along the strip. Cytiva has also developed pads with excellent wicking characteristics that give rise to greater consistencies. Choosing an absorbent with sufficient capacity is an important consideration when designing an immunoassay.

Features and benefits:

- **Consistent absorbency:** Ensures test-to-test reproducibility
- **Product manufactured in controlled environments from highest-quality materials:** No false results due to contamination
- **Naturally hydrophilic:** Minimal loss of analyte, so test sensitivity is maintained
- **Wide range of thickness, absorbency and wicking rate:** Rapid rewetting after prolonged storage
- **Minimal Leakage along the strip:** No contamination of test results

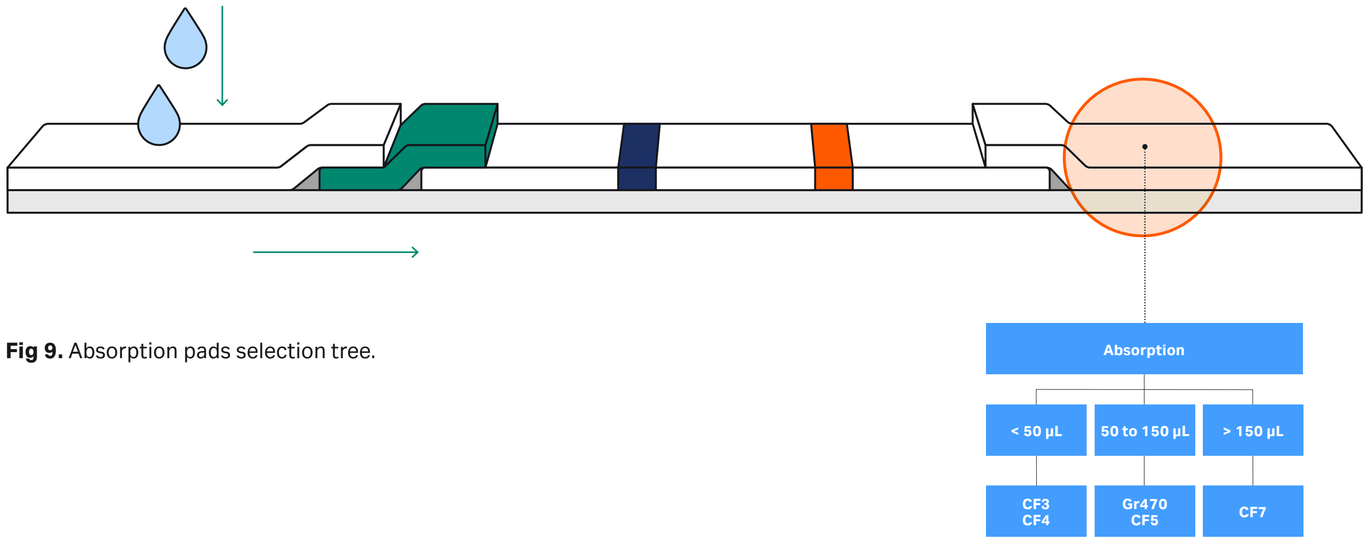

Fig 9. Absorption pads selection tree.

Flow-through immunoassays

In a flow-through immunoassay the sample is applied directly to the membrane surface and is allowed to wick through the membrane into an absorbent paper below.

Nitrocellulose membranes

Small-pore unsupported membranes such as BA83 and BA85 can be used; they are highly sensitive small-pore membranes with large surface area and high protein-binding capacity. However, they have to be carefully encapsulated, ensuring good contact between the membrane and the absorbent, to give good flow.

Features and benefits:

- **Manufactured for vertical-flow assays:** Eliminates problems caused by capillary rise
- **Small pore structure:** Accurate results; low nonspecific binding; greater sensitivity
- **One hundred percent pure nitrocellulose:** Provides high binding capacity

Absorbents

The absorbents used for flow-through assays must wick fast and be highly water absorbent. The volumes of liquids used in flow-through assays can be much higher than those in lateral flow. Thicker cellulose materials with fast wicking are therefore the material of choice.

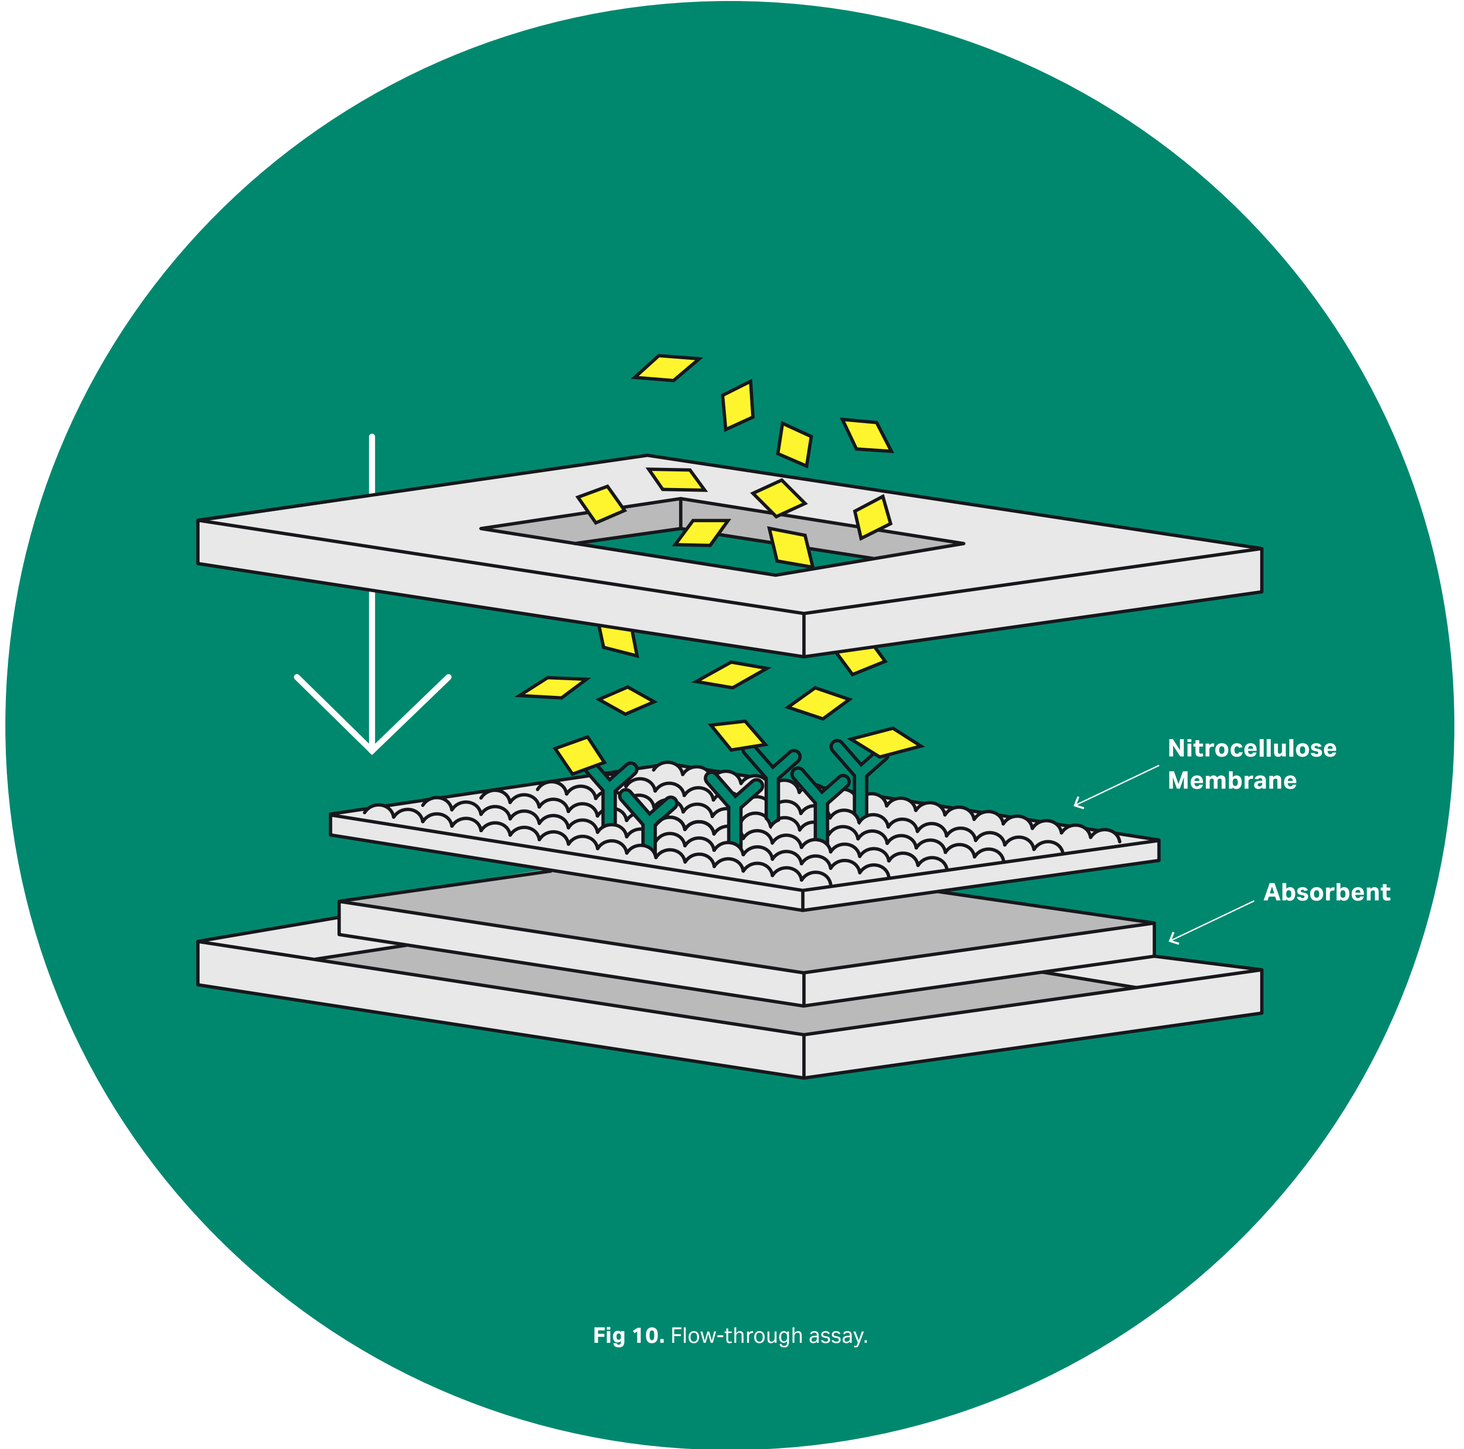

Fig 10. Flow-through assay.

Dipstick colorimetric assays

Dipstick colorimetric assays, in which a cellulose pad is impregnated with a color reagent, are widely used in everything from urine testing to environmental assays. The base cellulose is a key part of the system, and the correct choice of absorbency, wicking rate, and wet strength are critical to producing a working assay. The Cytiva range of cellulose materials for dipstick colorimetric assays offers highly consistent and inert substrates for absorption of the active chemicals required for development of dipstick tests.

The purity of the cellulose base material coupled with Cytiva quality manufacturing practices make these papers an exceptional choice for large-scale manufacturing. The Cytiva range of Whatman papers also includes a wet strengthened grade.

Lab-based immunodiagnostics

Immunoassay techniques have moved on substantially since the early days of radioactive immunoassays (RIAs). From enzyme-linked immunosorbent assays (ELISAs), to fluorescence spectroscopy, and more recent innovations such as multiplex assays and biosensors, these technological advancements have enabled the development of highly sensitive and specific assays for a broad and ever-growing range of analytes.

Sera-Mag™ carboxylate beads

Sera-Mag™ carboxylate-modified magnetic beads combine a fast magnetic response time and high binding capacity, sensitivity, stability and physical integrity.

- **Ease of use:** Covalent coupling of proteins, nucleic acids, etc. to carboxyl groups on the surface using standard coupling technologies
- **Convenient:** Isolation, selection and clean-up of nucleic acids or direct conjugation of specific oligos and enzymes
- Coefficients of variation (CV) between 5% and 10%

Sera-Mag streptavidin-coated magnetic particles

Sera-Mag streptavidin-coated magnetic beads provide solid phase support in immunoassays and molecular biology applications.

The magnetic streptavidin particles can also be used as a universal base particle for coating biotinylated proteins, oligos or other ligands to the particle surface.

- **Optimized application:** Contain covalently bound streptavidin with low (2500 to 3500 pmol/mg), medium (3500 to 4500 pmol/mg) or high (4500 to 5500 pmol/mg) biotin binding capacities, providing a choice of biotin-binding capacity
- **High capacity and precision:** For enrichment and targeted sequencing applications

Sera-Mag streptavidin-blocked magnetic beads

Sera-Mag speedbeads streptavidin-blocked magnetic particles provide high biotin-binding capacity along with a strong affinity for targeted, biotin-labelled molecules such as nucleic acids, proteins and peptides with very low nonspecific binding.

When the beads are combined with any of these molecules the strong non-covalent associate between the Streptavidin and biotin ensures efficient capture of the target molecule.

- **Increased throughput and precision:** The speedbead particles combine fast reaction kinetics and low, non-specific binding
- **Optimized for demanding applications:** Including bead-in PCR and enrichment

Sera-Mag amine-blocked magnetic beads

Provides low non-specific binding of proteins from the sample matrix.

Sera-Mag speedbeads amine blocked magnetic particles are uniform, colloidally stable, mono-dispersed, non-porous super-paramagnetic spheres made by a proprietary core-shell method. The core is a carboxylate-modified particle made by free radical emulsion polymerization of styrene and acid monomer. Magnetite (Fe3O4) is coated onto this core particle and then encapsulated with propriety polymers. The final surface is blocked using a proprietary method to help prevent nonspecific binding of proteins.

Sera-Mag speedbeads amine-blocked particles combine fast magnetic reaction kinetics and high binding capacity due to large surface area.

- Feature a non-surfactant, non-protein blocked surface to reduce the undesired adsorption of proteins from a sample matrix.
- Fast reaction kinetics increases throughput and precision, also enabling faster movement through viscous solutions.
- Unique cauliflower-like surface provides increased area for binding reactions compared to smooth surface particles.
- Uniform, nominal 1 µm diameter provides excellent lot-to-lot reproducibility.

Point-of-care molecular assays

Molecular testing in remote areas of the world is becoming a real possibility thanks to the developments in point-of-care testing devices which could prove a game-changer for the diagnosis of diseases such as tuberculosis, drug-resistant tuberculosis, HIV, and Ebola virus. These devices often contain highly sensitive membranes to effectively capture the cells or microorganisms for further analysis.

Track-etched membranes for diagnostic applications

Cytiva provides a range of Whatman track-etched membranes (TEMs) whose advanced technical specifications make them an outstanding choice for a wide range of diagnostic applications.

TEMs have very tightly controlled pore size distribution. This allows for quantification of cells or micro-organisms, which are captured on the membrane surface. TEMs are usually transparent at larger pore sizes, which allows complete transmission of light, ensuring excellent signal-to-noise ratio.

Features	Benefits
Biologically inert	Whole cell assays can be performed
Low protein binding and low extractables	There is no interference with assay results because of membrane
Choice of surface properties (hydrophilic and hydrophobic version available)	Assays can be designed with the appropriate flow or retention characteristics
Does not bind stains or labels	Gives lower background signal than traditional materials
True surface capture on a flat, smooth surface	Cells or particles are highly visible or available for sample recovery by backflushing
Low hold-up volume	Practically all the applied sample is available for analysis
Controllable optical properties (transparent, translucent, and/or dyed)	The optical properties can be chosen to ensure excellent signal-to-noise ratio. Clear materials allow complete transmission of light, whereas dyed varieties block signal from behind the membrane
PC or PET material	Allows easy attachment to a range of housings for design of components

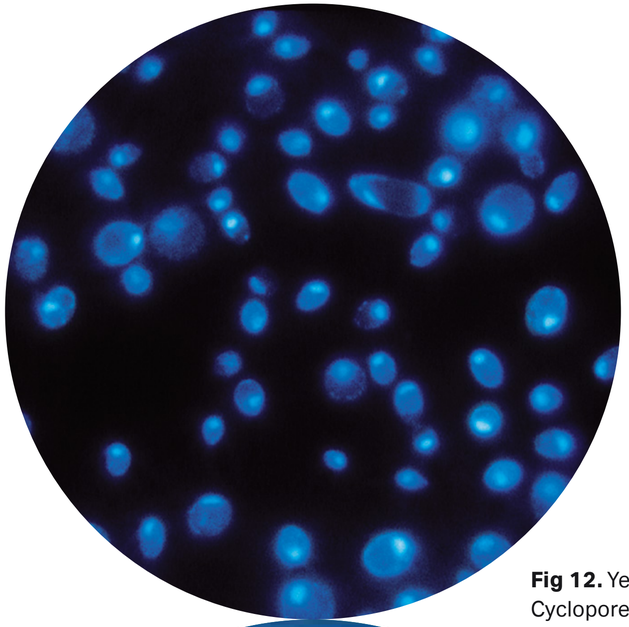

Fig 12. Yeast cells on Black Cyclopore™ with DAPI Stain.

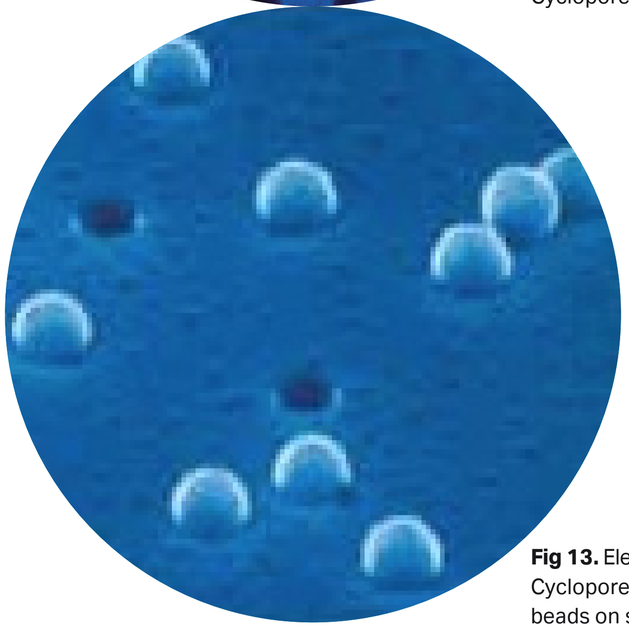

Fig 13. Electron micrograph of Cyclopore membrane with latex beads on surface.

Application examples

Cell capture

Since TEMs have tightly controlled filtration characteristics, they can be used in cell capture applications. This application allows for easier identification of marked cells in a number of formats. The retention of cells upon the membrane surface allows cells to be stained and observed in a very clear environment. The improved resolution and accuracy have applications in any area of clinical chemistry in which cells are observed. The reduced likelihood of a false diagnosis also has a significant impact, especially in large-scale screening procedures.

Particle-capture assays

Using membranes for particle-capture tests is a relatively well-known technique. The usefulness of these assays can be enhanced by using dyed or fluorescent latex particles as a label. Such labels can produce a more sensitive or stable assay. Using a TEM for particle capture allows for a more specific capture reaction, and capturing the particles on the membrane surface rather than in the depth of the membrane matrix enhances sensitivity.

Biosensors

TEMs provide accurate flow control of diffusion properties in biosensor applications in which the membrane acts as a barrier to biological cells and controls their flow to the sensor. The membrane also serves as a barrier to many potential contaminants, improving the assay's specificity. In applications involving the presence of biochemical reagents to measure the reaction, the pores can be filled with the desired materials (e.g., antigen or enzymes). The complete biosensor can therefore be dried onto the membrane.

Cytiva offers a complete range of track-etched membranes manufactured using proprietary technology to produce a precision membrane filter with a closely controlled pore size distribution.

Request a sample of our track-etched membranes visit: https://info.cytivalifesciences.com/wdx-molecular-lab-poc-assay

Lab-based molecular diagnostics

Molecular diagnostic tests using nucleic acid-based assays have become an essential component in the evaluation and early detection of many diseases. Applications in the areas of infectious diseases, oncology, inherited disorders, and prediction of genetic disease risk are rapidly becoming commonplace and are increasingly applied in the field of personalized medicine.

Reduce cost, gain greater geographical access, and simplify your workflow from sample collection to result by using our stabilization products and services:

- Product design
- Sample purification or isolation
- Assay components and room-temperature stabilization
- Sample clean-up and detection

SeraSil-Mag™ silica beads

SeraSil-Mag™ silica coated superparamagnetic beads deliver a high purity extraction solutions for highly sensitive applications when sample is scarce. The beads provide an optimal binding surface, with regular morphology, to optimize binding efficiency and reduce variability, simplifying the transition from column purification to bead-based purification. Optimized to isolate highly purified DNA/RNA for downstream applications such as qPCR or sequencing.

High iron oxide content (60 emu/g): Fast magnetic response (~5 s) shortens time of magnetic steps during isolation

- **Uniformity:** Particles are uniform in size (submicroscale diameter 700 nm and 400 nm [monodispersed]), providing narrow size distribution
- **Low sedimentation rate:** Good buoyancy enhances ease of handling, automation, and reproducibility
- **Purity:** Used to isolate and purify genomic DNA from whole human blood providing A260/A280 ratios between 1.70 to 1.90 and A260/A230 ratios as high as 2

Sera-Mag speedbead carboxylate-modified magnetic particles

Sera-Mag speedbeads have a second layer of magnetite applied through the same core shell design process, allowing a reaction twice as fast as the Sera-Mag carboxylate-modified beads when in the presence of a magnetic field. Speedbeads are especially useful where the reaction medium is highly viscous, and in clinical assays requiring a faster magnetic response time.

- **Convenient:** Isolation, selection and clean-up of nucleic acids or direct conjugation of specific oligos and enzymes
- **Reliable:** Fast, precise, and high binding capacity for sample preparation, nucleic acid isolation, proteomics and immunoassay applications

Sera-Mag oligo (dT) coated magnetic particles

Colloidally stable Sera-Mag oligo (dT) coated magnetic particles contain covalently bound oligo (dT)14 and will remain in suspension for extended periods of time in the absence of a magnetic field, making them well suited for capturing or isolating mRNA from a variety of sources.

Oligo (dT) particles can also be used as a universal base particle for coupling unique oligo sequences. Simply synthesize the oligo with a poly-A tail for easy attachment to the oligo (dT) particles.

- **Versatile:** Once isolated, selective purification of mRNA from total RNA for NGS, RT-PCR, cDNA library construction, or subtractive hybridization can be performed
- **Performance:** The approximate mRNA binding-capacity is 11 µg of mRNA per mg of particles (dependent upon sample and message length)
- Custom Oligo (dT) available for more specific sample focus binding

Diagnostic services

Value added services

Lyophilization
https://www.cytivalifesciences.com/solutions/genomics/products-and-technologies/custom-genomic-services/lyo-stable
Lyophilization, also known as freeze-drying or cryo-desiccation, is the process of stabilizing a solution by removing water from a it without applying heat. The patented technology stabilizes individual proteins, enzymes, reagents, or even complete multiplex assays by providing a molecular environment that protects against conformational changes in protein structure. The result is a product thatis stable at room temperature.

Magnetic bead conjugation
https://www.cytivalifesciences.com/Solutions/Genomics/Products-and-technologies/Custom-sera-mag-conjugation
Altering the surface properties that give magnetic beads their own binding properties, commonly known as surface functionalization, is achieved through ligand conjugation. Custom conjugation also optimizes magnetic beads through concentration, reformulation, binding, and adaption of particle sizes and functionalities.

Contract manufacturing
https://www.cytivalifesciences.com/solutions/genomics/products-and-technologies/custom-genomic-services/contract-manufacturing
Custom and contract manufacturing is done in ISO-certified manufacturing centers. These centers have to extensive capabilities and process rigor for the production for both low- and high-throughput volumes to an assured quality. Custom and contract manufacturing is available for everything from simple buffers to multicomponent kits and membrane-based assays for use in pharmaceuticals, diagnostic applications, and life science research.

Custom services

Product customization (same product but adapted)
https://www.cytivalifesciences.com/solutions/genomics/products-and-technologies/custom-genomic-services/custom-biology
When off-the-shelf products do not meet specific application requirements, properties of these product can be adapted while ensuring the same quality, performance, and reliability as standard catalog products. Customizable properties include purities, formulations, blends, pack sizes, dimensions, configurations (e.g., changing from sheets to reels or cut cards), grades, specifications and concentration.

Product development (new product)
https://www.cytivalifesciences.com/solutions/genomics/products-and-technologies/custom-genomic-services/custom-biology
New products developed an optimized for specific applications. These new products will be developed using the existing range of high-quality components (cellulose and glass fiber media, nitrocellulose membranes, capillary pore membranes, and Anopore™ inorganic membranes) and kits (protein and nucleic acid sample preparation, labeling, and detection).

Custom multiwell plate design
https://www.cytivalifesciences.com/solutions/genomics/products-and-technologies/custom-genomic-services/custom-plates
Custom multiwell, filter, and microplates for a range of applications and sample throughput levels. These plates are manufactured by applying our knowledge in membranes, resins, and mold tooling and are suitable for sample collection, analysis, and purification of sequencing reactions.

Sharing knowledge and experience

Classroom, onsite, and virtual education
https://www.cytivalifesciences.com/solutions/diagnostics/diagnostic-services/immunoassay-development-services
Direct access to diagnostic specialists, advanced labs, and specialized infrastructure to work through the basics of test development and how to build immunoassay tests.

Workshops and consultation services
https://www.cytivalifesciences.com/solutions/diagnostics/diagnostic-services/immunoassay-development-services
Designed to focus on one specific area of development, to overcome challenges and advance the development of an assay. Workshops build on classroom training.

Contract development services
https://www.cytivalifesciences.com/solutions/diagnostics/diagnostic-services/immunoassay-development-services
Support from an interdisciplinary team of engineers, biochemists, biologists, and filtration and separation experts. Gain assistance with surface plasma resonance (SPR) analysis reagent characterization, assay design concept, optimization, and development of custom components, products, solutions, and platforms in diagnostic development.

Custom and contract manufacturing

A collaboration with Cytiva offers real benefits

Many of Cytiva's products are used as tools and/or components in a range of applications in life sciences, diagnostics, pharmaceuticals, and environmental sciences. In addition, Cytiva can provide the extensive capabilities offered by our ISO-certified manufacturing centers, process rigor, lean manufacturing. Taken together, the portfolio and capabilities of Cytiva offer a world-class custom and contract manufacturing operation that provides all aspects of the manufacturing process to an assured quality.

Certification for our quality management systems

Contact us to learn more about our custom and contract manufacturing capabilities

Product design

Cytiva has extensive capabilities for design optimization and development of custom components. If you start working with our custom design team while you're still in the conceptual stage, we can help you design towards optimal manufacturing.

We can help design and prototype your vials, tubes, and other cartridge and holder devices for stabilized reagents.

Table 3. Examples of Cytiva capabilities in design optimization and development of custom components

Assay components and room-temperature stabilization

Lyo-Stable™ technology for custom reagent and assay stabilization

Cytiva's patented Lyo-Stable stabilization technology allows ambient-temperature shipping and storage of your individual reagents or complete multiplex assays in a convenient cake format.

Custom Ready-To-Go™ formulations can be prepared based on your existing assay composition.

Our in-house optimization expertise will assist the transfer to a stabilized format. Building on our existing portfolio of catalog Ready-To-Go products for research, we offer a full custom stabilization service.

With a dedicated custom team, including technical support, project management, and supply chain management, and ten years of development and manufacturing experience, we are well positioned to serve your molecular diagnostics application needs.

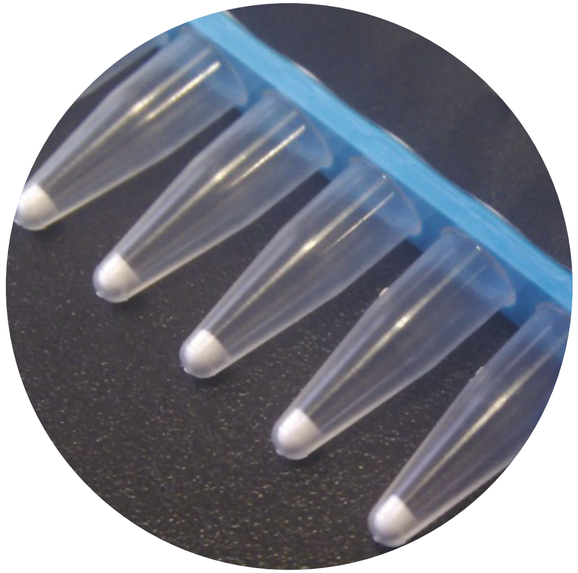

Fig 15. Example of a Ready-To-Go

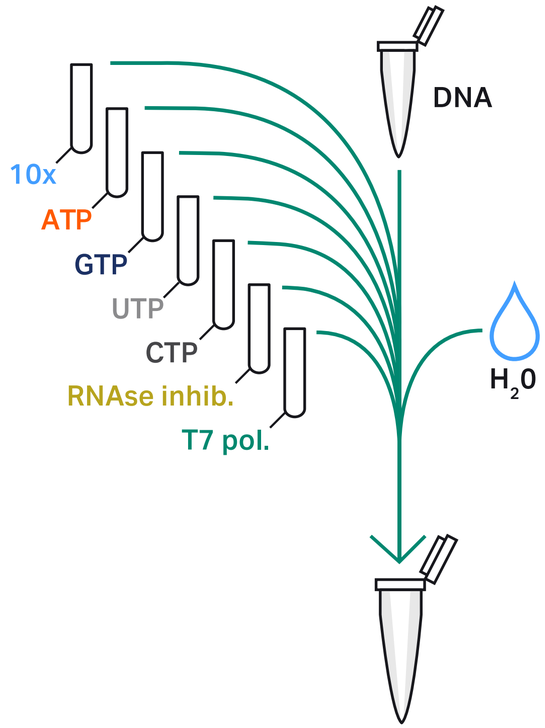
Comparison between Lyo-Stable and conventional approaches

Conventional approach



Lyo-Stable approach

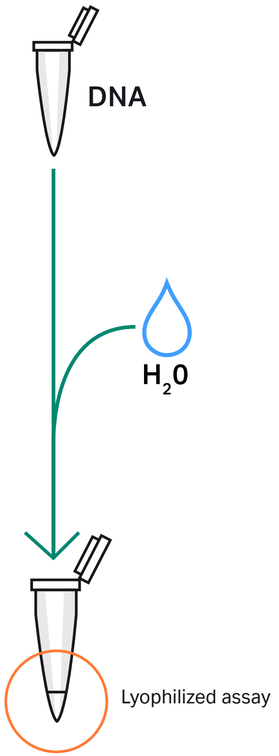


Fig 16. Moving from a multiple step conventional approach to a simplified two-step custom Lyo-Stable solution.

Benefits of Lyo-Stable technology

	Benefits for diagnostic kit manufacturers	Benefits for diagnostic kit users
Stabilization of assay mixtures	• Two-year stability at ambient temperature • Suitable for complex mixtures including sensitive enzymes and master mix components • Customizable formulation	• Two-year stability at ambient temperature
Simplification — Pre-dispensed, single-dose reagents	• Supports reduced training requirements • Compatible with downstream applications and automation	• Supports reduced training requirements • Compatible with downstream applications and automation • Fewer pipetting steps reduces cross-contamination risk and improves data reliability and overall quality of the assay
Shipping — Does not require dry or wet ice	• Simplifies shipping across countries and protects from unforeseen delays • Enables access to remote regions • Provides significant cost savings • Eco friendly	
Storage — No need for refrigerator or freezer storage	• Simplified inventory management • Reduces storage space and costs • Reduced energy consumption • Opens up new markets and target groups for your assays	• Simplified inventory management • Reduces storage space and costs • Reduced energy consumption • Supports applications for in-field or near-patient use
